**摘要:**为了探讨石菖蒲醇提物作为一种中药杀菌剂对病菌寄主植物本身防御酶体系的影响,该研究以番茄欧粉贝幼苗和川产道地中药石菖蒲为材料,采用冷浸法制备石菖蒲醇提物,经不同浓度石菖蒲醇提物对番茄幼苗进行处理,用比色法测定多酚氧化酶(PPO)、苯丙氨酸解氨酶(PAL)和过氧化物酶(POD)的活性,并利用GC-MS 联用技术,对石菖蒲醇提物的主要化学成分进行定性分析。结果表明:第1天,醇提物浓度在0.04~0.08 g·mL<sup>-1</sup>时,PAL活性显著高于对照;随后PAL活性随浓度升高降低;当浓度在0.04~0.16 g·mL<sup>-1</sup>时,POD活性与对照无显著差异;浓度为0.32 g·mL<sup>-1</sup>时,POD活性显著高于对照;浓度为0.64 g·mL<sup>-1</sup>时,POD活性显著低于对照;当浓度在0.04~0.32 g·mL<sup>-1</sup>时,PPO活性显著高于对照;浓度为0.64 g·mL<sup>-1</sup>时,PPO活性与对照无显著差异;随着时间的延长,三种酶各处理组之间的差异逐步减少。第4天时,各处理组之间PAL的活性无显著差异;当浓度为0.04 g·mL<sup>-1</sup>和0.64 g·mL<sup>-1</sup>时,PPO活性与对照无显著差异,其余范围均显著高于对照;当浓度在0.08~0.32 g·mL<sup>-1</sup>时,POD活性数值上均高于对照。以上表明在一定浓度范围内醇提物可以增强防御酶活性,未破坏植物的防御酶体系。因此,该醇提物作为一种新型的中药杀菌剂有巨大的开发和利用潜力。利用GC-MS 联用技术,可从醇提物中鉴定出30种化学成分,这些物质中多为苯丙素类物质,如β-细辛醚、α-细辛醚和顺式甲基异丁香油酚等,其中含量最高的物质为β-细辛醚(42.48%)。这提示在后续的研究中,可针对β-细辛醚等醇提物的主要化学成分进行。

**Abstract:** This paper aims to explore *Acorus tatarinowii* alcohol extracts as a kind of traditional Chinese herbal medicine fungicide effects on the plant defense enzyme system of fungi host. The test materials were tomato seedlings and Sichuan authentic herbal medicine *A. tatarinowii*. *A. tatarinowii* alcohol extracts were prepared by cold-maceration. The main experimental methods were colorimetric method and gas chromatography-mass spectrometry. The activity of plant defensive enzymes were examined by colorimetric method after the treatment of tomato seedlings using dif-

ferent concentrations of alcoholic extracts from *A. tatarinowii*. And the main chemical compositions of *A. tatarinowii* alcohol extracts were analyzed by gas chromatography-mass spectrometry. These results showed that when the concentration of *A. tatarinowii* alcohol extracts in  $0.04\text{--}0.08\text{ g}\cdot\text{mL}^{-1}$ , the activity of PAL was significantly higher than control groups on the first day. Then the activity of PAL reduced with the increase of the concentration of alcohol extract. And at the outset of the activity of POD had no significant difference on concentration condition of  $0.04\text{--}0.16\text{ g}\cdot\text{mL}^{-1}$ . When the concentration of *A. tatarinowii* alcohol extracts in  $0.64\text{ g}\cdot\text{mL}^{-1}$ , the activity of PAL was significantly lower than control groups. And the activity of PPO was significantly higher than control groups on concentration condition of  $0.04\text{--}0.32\text{ g}\cdot\text{mL}^{-1}$ . When in  $0.64\text{ g}\cdot\text{mL}^{-1}$ , the activity of PPO had no significant difference with control groups. But with the extension of time, the difference between each group of three enzymes was reduced. On the 4th day, the activity of PAL had no significant differences between treatment groups. When the concentration of alcohol extracts in  $0.04\text{--}0.64\text{ g}\cdot\text{mL}^{-1}$ , the activity of PPO had no significant differences with control groups. The activity of PPO was significantly higher than control groups on the scope of the other. When in  $0.08\text{--}0.32\text{ g}\cdot\text{mL}^{-1}$ , the activity of POD of values were higher than those in control groups. The results showed that *A. tatarinowii* alcohol extracts could influence the activity of plant defensive enzymes and a certain concentration of *A. tatarinowii* alcohol extracts could enhance it without damaging plants defense enzyme system. Therefore, *A. tatarinowii* alcohol extracts as a new type of traditional Chinese herbal medicine fungicide is a huge potential of development and utilization. And thirty chemical compositions were identified from *A. tatarinowii* alcoholic extracts by gas chromatography-mass spectrometry. The main chemical composition of *A. tatarinowii* alcohol extracts was phenylpropanoids such as  $\beta$ -asarone,  $\alpha$ -asarone and cis-Methylisoeugenol. The most abundant chemical composition was  $\beta$ -asarone. And the content of  $\beta$ -asarone in *A. tatarinowii* alcohol extracts accounted for 42.48%. And in follow-up studies, we can study the main chemical composition of *A. tatarinowii* alcohol extracts like  $\beta$ -asarone.

**Key words:** *Acorus tatarinowii*; tomato; defensive enzymes; GC-MS;  $\beta$ -asarone

番茄(*Lycopersicon esculentum*)是我国重要的蔬菜之一,但危害番茄较为严重的病害就有40余种,每年给番茄种植业造成巨大损失(赵统敏等,2011)。其中,番茄灰霉病菌(*Botrytis cinerea*)是严重影响番茄产量的重要病菌(Wang et al., 2010),该病菌危害大,繁殖快,抗病育种困难(Decognet et al., 2009),现主要依靠传统化学农药进行防治。随着传统化学农药所带来的环境和健康问题日益凸显,植物源农药因其环境友好型的特点成为了农药发展的新热点(单承莺等,2011)。

石菖蒲(*Acorus tatarinowii*)为天南星科菖蒲属多年生草本植物,味辛性温,具有保护神经细胞、抗癌、抗惊厥、抗心律失常、抗病虫害等作用(Li et al., 2010; 王睿等, 2013; Kim et al., 2003)。刘铁秋等(2013)发现石菖蒲醇提物对番茄灰霉病菌有显著抑菌效果,这使得以石菖蒲为原料研发中药杀菌剂成为可能。但关于该醇提取物对植物防御酶体系影响的研究一直未见报道。鉴于此,本文测定经醇提物处理后的番茄3种防御酶酶活并分析提取物的主要成分,以探讨其用于番茄灰霉病防治的实际意义,为石菖蒲中药杀菌剂的开发利用奠定科学的基础。

## 1 材料与方法

### 1.1 材料

石菖蒲根茎((*Rhizoma Acori tatarinowii*)),购自四川省成都市北京同仁堂总府路店;欧粉贝番茄幼苗,购自山东寿光旺盛种业总公司。

### 1.2 提取物制备

参考刘铁秋等(2014)的方法,制备原药浓度为 $1\text{ g}\cdot\text{mL}^{-1}$ 的醇提物。

### 1.3 对植株防御酶的影响

选择生长旺盛且长势基本相同的欧粉贝番茄幼苗进行试验。用浓度为 $0.04\text{、}0.08\text{、}0.16\text{、}0.32\text{、}0.64\text{ g}\cdot\text{mL}^{-1}$ 的石菖蒲醇提物均匀涂抹相同叶位的叶片正反面,无菌水作对照,3次重复。处理后1、2、3、4 d进行取样测定。苯丙氨酸解氨酶(PAL)活性测定参考秦培文等(2011)的方法,以1 min内 $\text{OD}_{290}$ 增加0.01为PAL的1个酶活力单位(U);多酚氧化酶(PPO)活性测定参考邹芳斌等(2008)的方法,以1 min内 $\text{OD}_{398}$ 增加0.01为PPO的1个活力单位(U);过氧化物酶(POD)活性测定参考关丽杰等

(2008)的方法,以每1 min  $OD_{470}$ 值变化0.01为1个酶活性单位(U)。

#### 1.4 GC-MS 条件

气相色谱条件:色谱柱为Agilent DB-5 MS DG;进样温度为250 °C;柱温60 °C保持5 min,再以20.0 °C·min<sup>-1</sup>速率升温至270 °C,保持5 min;溶剂延迟为3.5 min;载气为体积分数99.999%的高纯氮气;柱前压60 kPa;进样方式为GC自动进样器;进样量为0.2 μL,分流比为30:1。质谱条件:EI离子源温度为280 °C;MS四极杆温度为150 °C;电子能量为70 eV;接口温度为270 °C;质量范围为30~400 amu。

#### 1.5 分析方法

1.5.1 统计分析 采用PASW Statistics 18软件进行,显著性分析采用DMRT法( $P < 0.05$ )。

1.5.2 GC-MS分析 对总离子流图中的各峰进行质谱扫描,用色谱数据处理系统,以峰面积归一法确定各化学成分的相对含量。通过NIST 05质谱库检索和有关质谱资料查阅进行成分定性分析。

## 2 结果与分析

### 2.1 石菖蒲醇提物对番茄幼苗防御酶活性的影响

2.1.1 对苯丙氨酸解氨酶(PAL)活性影响 图1显示,第1天,当醇提物浓度为0.04~0.08 g·mL<sup>-1</sup>时,PAL活性显著高于对照;浓度高于0.08 g·mL<sup>-1</sup>时,PAL活性显著低于对照;第2天至第3天PAL活性变化规律同第1天,即浓度为0.04~0.16 g·mL<sup>-1</sup>时,PAL活性高于对照,浓度高于0.16 g·mL<sup>-1</sup>时,PAL活性显著低于对照;到第4天,各处理组PAL活性无显著差异仅数值上存在以上变化规律。这表明石菖蒲醇提物处理初期,低浓度处理可以激活PAL,高浓度处理有抑制PAL作用,但随着时间的延迟PAL水平又恢复到正常水平。

2.1.2 对多酚氧化酶(PPO)活性的影响 由图2可知,第1天,当醇提物浓度为0.04~0.32 g·mL<sup>-1</sup>时,PPO活性显著高于对照;当浓度为0.64 g·mL<sup>-1</sup>时,PPO活性与对照无显著差异。第2天,当浓度为0.04 g·mL<sup>-1</sup>时,PPO活性与对照无显著差异;当浓度为0.08~0.32 g·mL<sup>-1</sup>时,PPO活性显著高于对照;当浓度为0.64 g·mL<sup>-1</sup>时,PPO活性显著低于对照。第3天,当浓度为0.04~0.08 g·mL<sup>-1</sup>时,PPO活性与对照无显著差异;当浓度为

28	21.63	棕榈酸 Palmitic acid	C <sub>16</sub> H <sub>32</sub> O <sub>2</sub>	256	3.01
29	23.44	亚油酸 Linoleic acid	C <sub>18</sub> H <sub>32</sub> O <sub>2</sub>	280	1.65
30	26.17	己二酸二辛酯 Dioctyl adipate	C <sub>22</sub> H <sub>42</sub> O <sub>4</sub>	370	0.15

第4天,当浓度在0.08~0.32 g·mL<sup>-1</sup>时,PPO活性均显著高于对照;当浓度为0.04 g·mL<sup>-1</sup>和0.64

g·mL<sup>-1</sup>时,PPO活性与对照无显著差异。以上表明除第1天外低浓度醇提物处理对PPO活性无显

著影响,而高浓度醇提物处理在初期有抑制 PPO 作用,到了第 4 天抑制作用消失。

**2.1.3 对过氧化物酶(POD)活性影响** 由图 3 可知,第 1 天,当醇提物浓度为  $0.04\sim0.16\text{ g}\cdot\text{mL}^{-1}$  时,POD 活性与对照无显著差异;当浓度为  $0.32\text{ g}\cdot\text{mL}^{-1}$  时,POD 活性显著地高于对照;当浓度为  $0.64\text{ g}\cdot\text{mL}^{-1}$  时,POD 活性显著低于对照。第 2 天,当浓度为  $0.04\sim0.32\text{ g}\cdot\text{mL}^{-1}$  时,POD 活性显著高于对照;当浓度为  $0.64\text{ g}\cdot\text{mL}^{-1}$  时,POD 活性与对照无显著差异。第 3 天,当浓度为  $0.04\sim0.08\text{ g}\cdot\text{mL}^{-1}$  时,POD 活性与对照无显著差异;当浓度为  $0.16\sim0.32\text{ g}\cdot\text{mL}^{-1}$  时,POD 活性显著高于对照;当浓度为  $0.64\text{ g}\cdot\text{mL}^{-1}$  时,POD 活性显著低于对照。第 4 天,当浓度为  $0.04\text{ g}\cdot\text{mL}^{-1}$  时,POD 活性显著高于对照;当浓度为  $0.08\sim0.32\text{ g}\cdot\text{mL}^{-1}$  时,POD 活性数值上均高于对照;浓度为  $0.64\text{ g}\cdot\text{mL}^{-1}$  时,POD 活性显著低于对照。这表明高度醇提物处理有抑制 POD 的作用且抑制作用可持续,而低浓度处理后第 4 天仍可使 POD 活性保持在一个较高水平。

## 2.2 GC-MS 分析

对石菖蒲醇提物进行 GC-MS 测定,获得其总离子流色谱图(图 4)。从石菖蒲醇提物中共鉴定 30 种化学成分(表 4),占提取物总量的 89.09%。其中主要成分为  $\beta$ -细辛醚(42.48%)、 $\alpha$ -细辛醚(7.04%)、顺式甲基异丁香油酚(4.59%)、 $\gamma$ -细辛醚(4.05%)和  $\alpha$ -杜松醇(3.79 %)等。

## 3 讨论

防御酶活性增强是诱导抗病性产生的重要机制之一(Latha *et al.*, 2009)。在病原微生物侵染过程中 POD、PPO、PAL 等防御酶都为保护植物体起着重要的作用。POD 主要在木质素生物合成过程中催化  $\text{H}_2\text{O}_2$  分解而发挥作用;PPO 主要参与酚的氧化,形成对病菌毒性较高的醌类物质,从而构成保护性屏蔽而使细胞免受病菌的侵害;PAL 则是木质素与植保素沿苯丙烷类代谢途径合成的关键调节酶(Grosskopf *et al.*, 1990; Liu *et al.*, 2005; 刘姬艳等, 2010; 张绍珊等, 2010)。各浓度的石菖蒲醇提物处理初期,3 种防御酶活总体表现为 Hormesis 效应(高抑低促)。但随着时间的推移,不同防御酶活性变化有很大差异。其中 PAL 和 PPO 这两种酶的大多数处理组都在第 4 天恢复至正常水平。但在第 4

天时,POD 活性依然表现为 Hormesis 效应。可见随时间延长石菖蒲醇提物对 PAL 和 PPO 并无明显影响但对 POD 有明显诱导或抑制作用,从而引起植株本身抗病性的变化。

本研究中石菖蒲醇提物主要化学成分为苯丙素类,如细辛醚、甲基异丁香油酚,其中相对含量最高的物质为  $\beta$ -细辛醚。这与林双峰等(2004)的研究结果一致。除了苯丙素类物质外,石菖蒲醇提物还检出多种单萜类和倍半萜类物质,如石竹烯、杜松烯等。但石菖蒲中含量较少的成分类型,在不同文献中结果存在较大差异,这可能与中药的道地性有关(房敏峰等, 2009; 刘春海等, 2006)。而石菖蒲醇提物中具体哪些物质影响番茄防御酶活性及其影响机制,目前仍有待进一步研究。
